

GTM Engineering - Intern Assignment

myNachiketa

Build an AI-powered candidate screening platform

1 Objective

Build an **AI-powered candidate screening platform** that automates parts of the recruitment workflow.

The system should evaluate candidates using:

- Resume information
- GitHub activity
- Job description relevance
- Test performance

The system should automatically progress candidates through the hiring pipeline.

2 Dataset

A **sample dataset will be provided** to help you test and demonstrate your system.

The dataset will contain candidate information in CSV format.

Fields included:

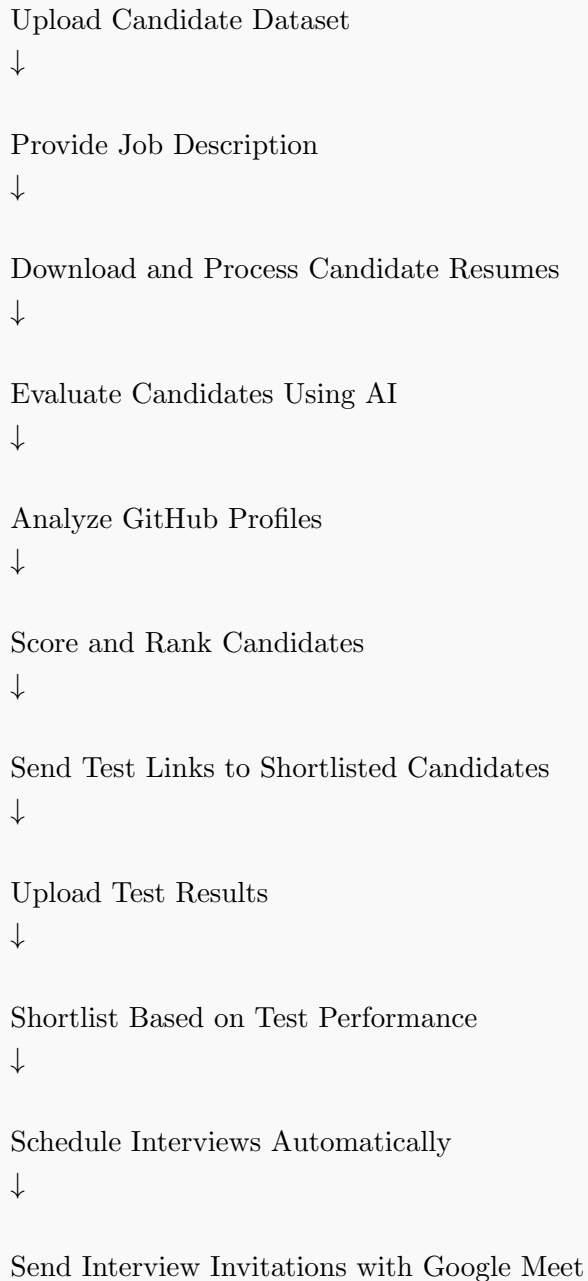

- Name
- Email
- College
- Branch
- CGPA
- Best AI Project
- Research Work
- GitHub Profile
- Resume Link

Additionally, a separate dataset containing **test results** will be provided with fields such as:

- Logical Aptitude Score (`test_1a`)
- Coding Test Score (`test_code`)

Your system should support uploading similar CSV datasets dynamically.

3 Expected Workflow

4 Functional Requirements

4.1 Candidate Data Upload

Allow recruiters to upload a CSV file containing candidate information.

4.2 Resume Processing

Download candidate resumes using the provided links and extract relevant information.

4.3 AI-Based Candidate Evaluation

Use AI methods to evaluate candidates against a provided job description.

4.4 GitHub Profile Analysis

Fetch and analyze GitHub repositories to evaluate candidate technical contributions.

4.5 Candidate Ranking

Design a method to score and rank candidates based on your evaluation approach.

4.6 Automated Emailing

Send automated emails to shortlisted candidates containing a test link.

Candidates must use their own email service for sending emails.

4.7 Test Result Upload

Allow recruiters to upload test results in CSV format.

4.8 Interview Scheduling

Automatically schedule interviews for qualified candidates using:

- Google Calendar integration
- Automatically generated Google Meet links

5 Constraints

- The application must be **publicly hosted**.
- Real **Google Calendar integration** is required.
- GitHub analysis must involve **repository-level evaluation**.
- Any LLM or AI framework may be used (open-source preferred).

6 Deliverables

Candidates must submit the following:

1. Hosted Application

A publicly accessible link to the working system.

2. GitHub Repository

Include source code and setup instructions.

3. **Architecture Document**

Explain your system design and AI evaluation approach.

4. **Demo Video (5–10 minutes)**

Demonstrate the full workflow of the application.

7 **Evaluation Criteria**

Submissions will be evaluated based on:

- System design quality
- AI reasoning and evaluation approach
- Automation of the recruitment workflow
- Code quality and engineering practices
- GitHub analysis methodology
- Scalability considerations

8 **Bonus Points**

Additional credit may be given for:

- Explainable AI scoring
- Recruiter dashboard
- Intelligent candidate ranking
- Scalable system architecture

9 **Time Limit**

Candidates are expected to complete the assignment within **60 hours**.
